Patent No. 5837466
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Engvall, Eva
APPLICANT: Leivo, Ilmo
ITILE OF INVENTION: Nucleic Acids Encoding Merosin
TITLE OF INVENTION: Nucleic Acids Encoding Merosin
TITLE OF INVENTION: Pragments and Uses Thereof
CORRESPONDENCE ADDRESS:
ADDRESSE: Campbell and Flores
STREET: 4370 La Jolla Village Drive, Suite 700
CITY: San Diego
STATE: California

Patent No. 6551795

GENERAL INCOMPATION:

RAPLICANT: MARC J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: MURBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR PILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

RIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 26035

This sequence represents the Cys-rich peptide sequence of legume plant derived insecticidal peptide PAlb corresponding to that of an entomotoxic pea protein. The invention relates to a novel insecticidal peptide PT (AAYS5990) isolated from pea plants which has homology to the PAID peptide and to the leginsuline from soybeans (AAYS5991). The insecticidal peptides preferably have the amino acid sequence:

XICySX2CySX3CySX4CySX5CySX6CySX7 where XI = 2-10 amino acids; XS = 2-5 amino acids; XS = 7-15 amino acids; XA = 3-10 amino acids; XS = 2-4 amino acids; XS = 7-15 amino acids; and X7 = 2-10 amino acids; B = 2-4 amino acids; A = 3-10 amino acids; A = 3-10
                                                                                                            Consensus, plant, legume, insecticide, entomotoxic, pea, cereal, grain, pest, Sitophilus oryzae, Ephestia kuehniellea, Acyrthosiphon pisum; genetically modified organism.

The invention provides a method for obtaining a plant which produces at least one seed having a modified phenotype. The method involves transforming a host plant cell with a DNA construct which consists of operably linked components in the direction of transcription, a promoter region from a Brassica plant gene, a DNA sequence of interest other than the native coding sequence, and a transcription termination region. The method is useful for obtaining plants having modified phenotype or for altering the phenotype of a plant seed or tissue. The DNA constructs are used in manipulating plant cells to provide for regulated transcription, such as light inducible transcription, in a plant tissue or plant part of interest at particular stages of plant growth or in response to external control. These constructs are also used for modulation of expression of endogenous products as well as production of exogenous products in the seed. Sequences AABB8936-13 represent fragments of storage proteins used in comparison studies with the storage protein 2A11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA

                                                                                                                                                                                                                                                     02-AUG-2001
        The invention relates to a DNA construct comprising, as operably linked components in the direction of transcription, a promoter region of components in the direction of transcription, a promoter region of containing an age of an acyl carrier protein (ACP) gene, a DNA sequence of interest other than the native components are functional in a plant cell and where the DNA construct is flanked by T-DNA. Also included are a plant cell having an altered phenotype as a result of expression of a DNA construct, a plant comprising a plant by a plant by a plant to impart a desired characteristic to seed as comprising a plant to impart a desired characteristic to seed as plant, obtaining a plant to impart a desired characteristic to seed as construct from other plant tissue, altering the phenotype of plant seed tissue and selectively expressing a heterologous DNA sequence of there are the plant tissue and selectively expressing a heterologous DNA sequence of the regulating genetic modification of plant to construct is useful in modifying or altering the genotype or phenotype of a plant to impart a desired characteristic. The construct is also useful construct is useful in modifying or altering the genotype or phenotype of a plant to impart a desired characteristic. The construct is also useful construct is useful in modifying or altering the genotype or phenotype or pendeced have increased capability of protein storage, improved nutrient construct in the hartient from charten means and construct in the plants of construct and plants and dehydration resistance and construct and construct are constructed response to light and dehydration resistance and construct and plants or means and construct and plants or means and construct and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            resistant to herbicide and pests. The seed specific promoters are from the Napin, ACP and EA9 genes and the fruit specific promoter is from the tomato 2A11 gene. The present sequence is a reactive site from a protein similar to the tomato 2A11 protein (thought to be a protease inhibitor).
                                                                                                                                                                                                                                                                                                                          New DNA construct comprising a promoter region, a DNA sequence of interest and a transcription termination region, useful for producing transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to novel isolated polypeptides (I), and definition relates to novel isolated polypeptides (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. congenital and acquired immunodeficiencies, autoimmune confirmations organ transplant rejections and graft versus host disease, infectious diseases (e.g. hepaticis (), bleeding disorders, hemoglobin abnormalities and cother blood-related disorders (sickle cell anaemia), myeloproliferative disorders (e.g. Gaucher's disease and cancer), neurodegenerative disorders (e.g. Gaucher's disease, Parkinson's disease), chromosomal abnormalities (C.g. Gaucher's disease, Parkinson's disease), chromosomal abnormalities (c.g. Gaucher's disease), achoemic injury (e.g. stroke), renal disorders (e.g. capithelial cell proliferation, endocrine disorders (e.g. arrhythmia), cardiovascular disorders (e.g. arrhythmia), capithelial cell proliferation, endocrine disorders (e.g. Addisease), reproductive system disorders (cirrhosis), as stimulators of disease), reproductive system disorders (cirrhosis), as stimulators of cirrhosis, and as a means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AMU17059.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human, autoimmune disease; Parkinson's disease; silicosis; gastrointestinal disease; atherosclerosis; haemophilia; thrombocytopenia; mamunosuppressive agent; adjuvant; enhance immune response; higher affinity antibody induction; increased serum immunoglobulin concentration.
                                                                                                                                                                                                                                                                                                                                               Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders.

The invention relates to an isolated polypeptide. The polypeptide is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, by determining the presence or amount of expression of the polypeptide in a biological sample and diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the presence or amount of expression of the polypeptide is also useful for identifying a binding partner and determining whether the binding partner of the polypeptide. The polypeptide is useful for identifying a binding partner and determining whether the binding partner of effects an activity of the polypeptide. The polypeptide or the nucleic acid encoding the polypeptide is useful for preventing, treating, or ameliocating a medical condition, which involves administering the polypeptide or the nucleic acid to a mammalian subject. The nucleic acid encoding a pathological condition or a susceptibility to a pathological condition or susceptibility to a pathologic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypoperide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at

Company of the printed specification, but was obtained in company of the company of the

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed construction of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colympopide in tissue, as molecular weight markers and as a food supplement. (II) and its binding pattners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders (involving aberrant protein expression or biological activity. The colympopide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations creponable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; chromosome mapping; gene mapping; gene therapy; forensi

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations are also assess biodiversity and account of the constant of the mapping, identification of mutations and constant of the constant 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28.4%; Score 63; DB 4; Length 2901; 46.2%; Pred. This is the amino acts sequence of the numan laminin derived protein object of the invention is to use laminin, laminin-derived protein cobject of the invention, deposition, accumulation and/or persistence in amyloid formation, deposition, accumulation and/or persistence in Alzheimer's disease and other amyloidoses. The laminin products (see AMWEG0889-98) may include mouse or human laminin A chain, laminin BI corresponded to the laminin A chain and (merosin), laminin Glorain, laminin BI comprises of the laminin A chain and the beta-amyloid binding domain of the laminin A chain, A claimed method for treating an amyloid disease comprises administering a polypeptide having a conformational similarity to a fragment of a laminin protein. A method for diagnosing an amyloid disease involves determining levels of laminin in a sample. Production of disease involves determining levels of laminin in a sample. Production of laminin or its fourth globular repeat in vivo provides a method for in vivo inhibition of beta-amyloid amyloidosis. The products and methods can be used for the dispnosis, monitoring and treatment of amyloidoses such as Alzheimer's disease, bown's syndrome and hereditary crebral haemorrhage with amyloidosis of the Dutch type (where the amyloidoses such as Alzheimer's disease, bown's syndrome and hereditary crebral haemorrhage with multiple myelome and other B-cell Mediterranean Fever (AA amyloid or inflammation-associated with type II consormalities (AL amyloid), the amyloidosis associated with type II consormalities (AL amyloid), the amyloidosis associated with prion disease, Gertetmann-Straussler Syndrome, kuru and animal scrapie (PrP amyloidosis associated with engaled and sease including Creutzfeldt-Jacob disease, Gertetmann-Straussler Syndrome, kuru and animal scrapie (PrP amyloidosis associated with engaled and panilal Amyloidosis associated with engaled a
                                                                                                                                                                                                                                                                       is the amino acid sequence of the human laminin A chain. The primary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated polypeptide (I) comprising:

(a) any of the 34 fully defined sequences (P) (see SEQ ID NO:2n, where n is a niteger between 1 and 34); (b) a mature form of (a); or (c) a conservative amino acid substitutions in. (I) can be encoded by a nucleic acid molecule (II), where the sequence is selected from the group consisting of SEQ ID NO:2(n-1). (I) and (II) have antidiabetic, anotropic, neuroprosective, antiparkinsonian, anticonvulsant, orteopathic, antiparkinsonian, anticonvulsant, orteopathic, antidiapemic, vulnerary and antiangiogenic activities, and antiasthmatic, antilipaemic, vulnerary and antiangiogenic activities, and antibodies that immunospecifically bind (I), can be used in the manufacture of a medicament for treating a syndrome associated with a human disease such metabolic disorders, disabetes, obseity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), cardiovascular diseases (hypertension, atherosclerosis), enurodegenerative disorders, asthma, and various dyslipidaemias. (I) and interest entry asthmatory skin disorders, asthma, and various dyslipidaemias. (I) and small and about a the sequence for the identification of small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in gene ration of antibodies that bind immunospecifically to (I) for use in therapeutic or diagnostic methods (I) can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                          Shimkets RA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

                                               The present invention relates to novel NOVX polypeptides and their encoding polynucleotides. The invention is useful in diagnosing, treating and preventing NOVX-associated disorders such as cardiowypathy, atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, infections, haemophilia, graft-versus-host disease, AIDS (acquired immune deficiency syndrome), asthma, Crohn's disease, multiple sclerosis, anorexia, cancer-associated cachexia, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, haematopoietic disorders, dyslipidaemias and other wasting disorders associated with chronic diseases. The invention is also useful as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The invention is also useful in gene therapy and in the preparation of vaccines. The present sequence is human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; antidiabetic; anorectic; cardiant; hypotensive; antidiateriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; antihelminthic; nootropic; neuroprotective; antiperkinsonian; anticonvulsant; osteopathic; antialipaemic; antilipaemic; antinflammatory; dermatological; antiasthmatic; antilipaemic; vulnerary; antiangiogenic; gene therapy; metabolic disorder; diabetes; obesity; infectious disease; ancreate, cancer; cardiovascular disease; hypertension; atherosclerosis; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; epilepsy; immune disorder; ostecarthritis; hemitopoletic disorder; inflammatory skin disorder;

The present invention describes an isolated polypeptide (I) comprising:

(a) any of the 34 fully defined sequences (P) (see SEQ ID NO:2n, where not is an integer between 1 and 34); (b) a mature form of (a); or (c) a conservative amino acid substitutions in. (I) can be encoded by a nucleic acid molecule (II), where the sequence is selected from the group consisting of SEQ ID NO:2(n.). (I) and (II) have antidiabetic, ancretic, cardiant, hypotensive, antiarteriosclerotic, ancretic, ancettic, antidiaperic, antidiaperic, antidiaperic, antidiaperic, antidiaperic, antidiaperic, antidiaperic, antidiamentory, dermatological, antidiathmatic, antidiaperic, and antidiaperic acid molecules (II) and antibodies that immunospecifically bind (I), can be used in gene therapy. The polypeptides (I), nucleic acid molecules (II) and antibodies that immunospecifically bind (I), can be used in the manufacture of a medicament for treating a syndrome associated with a chuman disease. They are useful for treating a syndrome associated with a chuman disease. They are useful for treating protozoal), anorexia, cancer, cardiovascular diseases (hypertension, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), cardiovascular diseases (setecarthritis), haematopoietic disorders, ephlepsy, immune disorders, asthma, and various dyslipidaemias. (I) and conting the manufacture of a transporter for the identification of small and a target for the identification of small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in gene ration of antibodies that bind immunospecifically to (I) for use in therapeutic or diagnostic methods. (I) can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the present invention.

The present invention relates to novel NOVX polypeptides and their encoding polynucleotides. The invention is useful in diagnosing, treating and preventing NOVX-associated disorders such as cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, infections, haemophilia, graft-versue-host disease, AIDS (acquired immune deficiency syndrome), asthma, Crohn's disease, multiple sclerosis, ancera, cancer-associated cachexia, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, haematopoietic disorders dyslipidaemias and other wasting disorders associated with chronic diseases. The invention is also useful as hybridisation probes, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New NOVX polypeptide, for preventing or treating e.g. cancer, diabetes, atherosclerosis, asthma or acquired immunodeficiency syndrome (AIDS), and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The invention is also useful in gene therapy and in the preparation of vaccines. The present sequence is human NOVX protein.

The present invention describes an isolated polypeptide (I) comprising:

(a) any of the 34 fully defined sequences (P) (see SEQ ID NO:2n, where n is an integer between 1 and 34); (b) a mature form of (a), or (c) a sequence that is at least 95% identical to (P), or having one or more conservative amino acid substitutions in. (I) can be encoded by a nucleic acid molecule (II), where the sequence is selected from the group consisting of SEQ ID NO:2(n-1). (I) and (II) have antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, antihelminthic, nootropic, neuroprotective, antiparkinsonian, anticonvulsant,
                                                                                                                                                                                                                                            human; antidiabetic; anorectic; cardiant; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; antihelannthic; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; osteopathic; antilipaemic; anticonvulsant; osteopathic; antilipaemic; anticonvulsant; osteopathic; antilipaemic; vulnerary; antiangiogenic; gene therapy; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; cardiovascular disease; hypertension; atherosclerosis; neurodegenerative disorder; alzheimer's disease; Parkinson's disease; epilepsy; immune disorder; betteostivitis; hematopoletic disorder; inflammatory skin disorder;

can be used in gene therapy. The polypeptides (I), mucleic activities, and antiasthmatic, antilipaemic, vulnerary and antiangiogenic activities, and can be used in gene therapy. The polypeptides (I), mucleic acid molecules (II) and antibodies that immunospecifically bind (I), can be used in the manufacture of a medicament for treating a syndrome associated with a confidence of the metabolic disorders, diabetes, obseity, infectious diseases (Viral, bacterial, fungal, helminthic, and protocoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), anorexia, cancer, cardiovascular diseases (Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders, asthma, and various dyshipidaemias. (I) and continguation of unition of small (II) may also be used as targets for the identification of small (II) and differentiation, cell proliferation, hematopoiesis, wound healing and immunospecifically to (I) for use in therapeutic or diagnostic methods. (I) can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present continued the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; antidiabetic; anorectic; cardiant; hypotensive; antidiateriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; antihelminthic; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; osteopathic; antiarthritic; antiparkinsonian; anticonvulsant; antiasthmatic; antilipaemic; vulnerary; antiangiogenic; gene therapy; metabolic disorder; diabetes; obesity; infectious disease; ancexia; cardiovascular disease; hypertension; atherosclerosis; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; epilepsy; immune disorder; osteoarthritis; haematopoletic disorder; inflammatory skin disorder;

The present invention describes an isolated polypeptide (I) comprising:

(a) any of the 34 fully defined sequences (P) (see SEQ ID NO:2n, where not as an integer between 1 and 34); (b) a mature form of (a); or (c) a sequence that is at least 95% identical to (P), or having one or more conservative amino acid substitutions in. (I) can be encoded by a nucleic acid molecule (II), where the sequence is selected from the group consisting of SEQ ID NO:2(n-1). (I) and (II) have antidiabetic, ancretic, cardiant, hypotensive, antiarteriosclerotic, anorectic, or virucide, antibacterial, fungicide, protozoacide, antihalmithic, or virucide, antibacterial, fungicide, protozoacide, antihalmithic, costeopathic, antiarthritic, antihalminflammatory, dermatological, antisathmatic, antiharthritic, antihalminflammatory and antibacture of a medicament for treating a syndrome associated with a channal decrease. They are useful for treating a syndrome associated with a human disease such metabolic disorders, diabetes, obesity, infectious disease, controlegenerative disorders, halphalminflam, anticoscolerosis, cardiovascular diseases (Nypertension, atherosclerosis), anorexia, cancer, cardiovascular diseases (Nypertension, and various dyslipidaemias. (I) and differentiation, cell proliferation, thematopolesis, wound healing and angiogenesis, in gene targets for the identification of small differentiation, cell proliferation, heamatopolesis, wound healing and angiogenesis, in gene therapy, in gene ration of antibodies that bind inthe exemplification probes, in chromosome mapping, cell manusopecifically.
                                                                                           Kekuda R;
Shimkets RA;
                                                                                                                                                                                                                                          New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  atherosclerosis; hypertension; scleroderma; obesity; cancer; diabetes; infection; haemophilia; graft-versus-host disease; AIDS;

The present invention relates to novel NOVX polypeptides and their encoding polynucleotides. The invention is useful in diagnosing, treating and preventing NOVX-associated disorders such as cardiomyopathy, at the respective of scleroderma, obseity, cancer diabetes, infections, haemophilia, graft-versus-host disease, AIDS (acquired immune deficiency syndrome), asthma, Crohn's disease, multiple sclerosis, anorexia, cancer-associated cachexia, neurodegenerative disorders anorexia, cancer-associated cachexia, haematopoietic disorders, dyslipidaemias and other wasting disorders associated with chronic diseases. The invention is also useful as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The invention is also useful in gene therapy and in the preparation of vaccines. The present sequence is human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New NOVX polypeptide, for preventing or treating e.g. cancer, diabetes, atherosclerosis, asthma or acquired immunodeficiency syndrome (AIDS), and in chromosome mapping, tissue typing or pharmacogenomics.
              multiple sclerosis; anorexia; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; haematopoietic disorder; dyslipidaemia; wasting disorder; chromosome mapping; tissue typing; preventive medicine; pharmacogenomic; gene therapy; vaccine; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Kekuda R;

New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

Claim 1; SEQ ID NO 10; 234pp; English.

asthma, or infections.

```
The present invention relates to novel NOVX polypeptides and their encoding polynucleotides. The invention is useful in diagnosing, treating and preventing NOVX-associated disorders such as cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, infections, haemophilia, graft-versue-host disease, AIDS (acquired immune deficiency syndrome), asthma, Crohn's disease, miltiple sclerosis, ancexia, cancer-associated cachexia, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, haematopoietic disorders, dyslipidaemias and other wasting disorders associated with chronic diseases. The invention is also useful as hybridiation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The invention is also useful in gene therapy and in the preparation of vaccines. The present sequence is human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä

The present invention describes an isolated polypeptide (I) comprising:

(a) any of the 34 fully defined sequences (P) (see SEQ ID NO:2n, where not is an integer between 1 and 34); (b) a mature form of (a); or (c) a conservative amino acid substitutions in. (I) can be encoded by a nucleic acid molecule (II), where the sequence is selected from the group consisting of SEQ ID NO:2(n.). (I) and (II) have antidiabetic, anorectic, antidiabetic, antidiabetic, antidiabetic, anotoprotective, antidiatematory, dermatological, and antibodies antidiametory, and antidonvulsant, and antibodies that immunospecifically bind (I), can be used in gene therapy. The polypeptides (I), nucleic acid molecules can metabolic aneuroprotects, and protecting a syndrome associated with a manufacture of a medicament for treating a syndrome associated with a chuman disease. They are useful for treating, preventing or diagnosing (viral, bacterial, fungal, helminthic, and protecoal), anorexia, cancer, cardiovascular diseases (Hypertension, atherosclerosis), cardiovascular diseases (Appertension, atherosclerosis), anorexia, cancer, cardiovascular diseases (Appertension, atherosclerosis), anorexia, cancer, epplepsy, immune disorders, asthma, and various dyslipidaemiae. (I) and antianmacory skin disorders, asthma, and various dyslipidaemiae. (II) and antiangles of the identification of small

The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOVX; diagnosis; NOVX-associated disorder; cardiomyopathy; atherosclerosis; hypertension; scleroderma; obesity; cancer; diabetes; infection; haemophilia; graft-versus-host disease; AIDS; acquired immune deficiency syndrome; asthma; Crohn's disease; multiple sclerosis; anorexia; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease;

(CURA-) CURAGEN CORP.

```
The present invention relates to novel NOVX polypeptides and their encoding polynucleotides. The invention is useful in diagnosing, treating and preventing NOVX-associated disorders such as cardiomyopathy, atherosclerosis, hypertension, scleroma, obesity, cancer, diabetes, infections, haemophila, graft-versus-host disease, ADDS (acquired immune deficiency syndrome), asthma, Crohn's disease, multiple sclerosis, anorexia, cancer-associated cachexia, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, haematopoletic disorders dysliphdaemias and other wasting disorders associated with chronic diseases. The invention is also useful as hybridisation probes, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New NOVX polypeptide, for preventing or treating e.g. cancer, diabetes, atherosclerosis, asthma or acquired immunodeficiency syndrome (AIDS), and in chromosome mapping, tissue typing or pharmacogenomics.

```
The present invention describes an isolated polypeptide (I) comprising:
    (a) any of the 34 fully defined sequences (P) (see SEQ ID NO:Zn, where n is an integer between 1 and 34); (B) a mature form of (a); or (c) a sequence that is at least 95% identical to (P), or having one or more conservative amino acid substitutions in. (I) can be encoded by a nucleic acid molecule (II), where the sequence is selected from the group consisting of SEQ ID NO:Z(n-1). (I) and (II) have antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, antihelminthic,
                                                                                                                                                                                                                                                                                                                    vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kekuda R;
Shimkets RA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

osteopathic, autivativentry, autivativentry, dermatological, antiasthmatic, antilipaemic, unlinflammatory, dermatological, antiasthmatic, antilipaemic, valinerary and antianglogenic activities, and can be used in gene therapy. The polypeptides (1), nucleic acid molecules (1) and antibodies that immunospecifically bind (1), can be used in the manufacture of a medicament for treating a syndrome associated with a human disease. They are useful for treating, preventing or diagnosing diseases. They are useful for treating, preventing or diagnosing (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), cultimatory skin disorders, asthma, and various dyslipidaemias. (1) and cinflammatory skin disorders, asthma, and various dyslipidaemias. (1) and cinflammatory skin disorders, asthma, and various dyslipidaemias. (1) and differentiation, cell proliferation, hematopoiesis, wound healing and angiogenesis, in gene therapy, in gene ration of antibodies that bind immunospecifically to (1) for use in therapeutic or diagnostic methods. (1) can also be used as hybridisation probes, in chromosome mapping, in charantiva madidians and harmanonenemics. The present

The present invention relates to novel NOVX polypeptides and their encoding polynucleotides. The invention is useful in diagnosing, treating and preventing NOVX-associated disorders such as cardiomyopathy.

atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, infections, haemophilia, graft-versus-host disease, AIDS (acquired immune deficiency syndrome), asthma, Crohn's disease, multiple sclerosis, anorexia, cancer-associated cachexia, neurodegenerative disorders such as Alzheimer's disease, parkinson's disease, haematopoietic disorders dyslipidaemias and other wasting disorders associated with chronic diseases. The invention is also useful as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The invention is also useful in gene therapy and in the preparation of vaccines. The present sequence is human NoVX protein.

New NOVX polypeptide, for preventing or treating e.g. cancer, diabetes, atherosclerosis, asthma or acquired immunodeficiency syndrome (AIDS), and in chromosome mapping, tissue typing or pharmacogenomics.

The invention relates to a novel nucleic acid encoding a PRO polypeptide. The polypeptides and polynucleotides of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Blison syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, Als, neuropathies, dermal scarzing and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple infertility, premature agging, ALDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the human

The present invention describes an isolated polypeptide (I) comprising:

(a) any of the 34 fully defined sequences (P) (see SEQ ID NO:2n, where not is an integer between 1 and 34); (b) a mature form of (a); or (c) a conservative between 1 and 34); (b) a mature form of (a); or (c) a conservative amino acid substitutions in. (I) can be encoded by a mucleic consisting of SEQ ID NO:2(n-1). (I) and (II) have antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, or virucide, antibacterial, fungicide, protozoacide, antihelminthic, corecopathic, antiarthritic, antiarthriammatory, dermatological, antiarthritic, antiarthritic, antiarthriammatory, dermatological, antiarthritic, antiarthriammatory, dermatological, antiarthritic, antiarthriammatory, dermatological, and antibodies that immunospecifically bind (I), can be used in the manufacture of a medicament for treating a syndrome associated with a human disease. They are useful for treating preventing or diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, sethemses, obesity, infectious disease, consultation, also be used as targets for the identification of small consultation, cell proliferation, hemmatory shuth and various dysliptidemias. (I) and cardiovascular modulate or inhibit e.g. neurogenesis, cell immunospecifically to (I) can also be used as targets for the identification of small or immunospecifically to (I) can be used as hybridiastion probes, in chromosome mapping, immune the propertion of antibodies that prosent in the probes, in the propertice or inhibit or in canding expension or dispensed in the propertice. The propertice of the propertice or inhibit or in the probes in the propertice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kekuda R;
Shimkets RA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                preventive medicine, and pharmacogenomics. The present of in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anderson DW, Burgess CE, Casman SJ, Gorman L, Ji W,
